

ABSTRACT OF THE DISCLOSURE

A plastic barrel, embodied as a bung barrel or a lid barrel, is manufactured as a single-layer container or multi-layer container by extrusion blow molding. The plastic barrel has a barrel body having an inner surface and an outer surface. The barrel body has sections integrated into the barrel body, wherein the sections are made of electrically conducting plastic material and form electric connections between the inner surface and the outer surface of the barrel body so that electric charges of the interior of the barrel can be dissipated to the outer surface.
